STEPHEN SHARPE COACHING

START UP PACK

WELCOME TO SS COACHING

Thank you for choosing to work with me – I'm excited to be part of your journey. Whether your goal is fat loss, muscle building, or a complete physique transformation, this pack will give you everything you need to get started the right way.

Inside, you'll find details about your check-ins, training, nutrition, supplements (if applicable), and how we'll communicate daily. Everything is built around you – your lifestyle, goals, and level of experience – with real, proven structure that delivers results.

This is a partnership. I'll be here with you every step of the way to guide, adjust, and hold you accountable – all I ask is that you show up consistently and trust the process.

Let's get to work.

– Stephen Sharpe

WHAT I NEED FROM YOU

What I Need From You Daily:

1. Cardio Proof

- Send a photo or screenshot once cardio is complete

(e.g. treadmill display, watch app, machine screen)

- Must clearly show duration, distance, or intensity

2. Step Count

- Send a screenshot of your total daily steps at the end of the day

3. Meal Photos

- Send a photo of every meal you eat throughout the day
- Helps me monitor digestion, adherence, and meal timing
- Include timestamps or note the time eaten if possible

4. Training Clips

- Send 2 to 4 clips per training session
- Prioritise compound lifts and areas we're focusing on
- Ensure the video is clear and shows proper form and effort

5. Daily Check-In Message

- Brief update on how you're feeling physically and mentally
- Report any issues: fatigue, injury, digestion, sleep, stress, etc.
- Always keep me in the loop - communication is key

HOW TO CHECK IN

How to Check In

Your bi weekly check-in is one of the most important steps in your coaching journey. It allows me to monitor your physical progress, recovery, digestion, mood, training performance, and overall health – so I can make informed adjustments to your plan.

Please follow this guide carefully every check-in day to ensure we're tracking your progress as accurately as possible.

Progress Pictures - Instructions

- **What to send: Front, side, and back photos**
- **When to take them: First thing in the morning, before eating or drinking, and after using the bathroom**
- **Clothing: Same posing shorts or underwear each week**
- **Lighting: Always use the same location, lighting, and time of day for consistency**
- **Camera: Use the back camera, not the front/selfie camera**
- **Image quality: Ensure photos are clear and not blurry (use timer or tripod if needed)**
- **No filters or edits**

CHECK IN FORMAT

(Copy, paste the questions below and send to my what's app on check ins days along with your answers)

Weekly Check-In Format

1. Bodyweight

- Current weight this morning:
- Weight at last check-in:

2. Progress Photos

(Attach front, side, and back pictures)

3. Digestion

- How's digestion been? (bloating, gas, bowel movements):
- How do you feel after meals?

4. Hunger & Cravings

- Hunger levels between meals:
- Any cravings?

5. Sleep

- Average hours per night:
- Sleep quality (1-10):

6. Energy Levels

- Morning energy:
- Mid-day energy:
- Training energy:

7. Training Performance

- Strength, pumps, focus:
- Any movements feeling weak or uncomfortable?

8. Cardio & Steps

- Cardio completed (type + duration):
- Daily step average:
- Any missed sessions?

9. Mood & Stress

- Overall mood this week:
- Any major stress, life changes, or emotional struggles?

10. Adherence

- Were you 100% on plan? (meals, cardio, training):
- If not, explain what was missed and why:

11. Menstrual Cycle (if applicable)

- First day of last bleed:
- Current day of your cycle:
- Using any contraception or cycle control? (pill, IUD, implant, etc.):

12. Notes/Questions for Me

- Anything else you'd like to share or ask?

TRAINING CLIPS

Training Clips - Why They Matter and How to Record Them

Sending 2 to 4 training clips per session is a non-negotiable part of your coaching. These videos are essential so I can assess your exercise execution, intensity, and progression. Watching your form allows me to spot issues before they turn into injuries, make technical corrections, and ensure you're training hard enough to actually change your physique.

Why I Need These Clips:

✓ Monitor Execution:

I can assess your form, tempo, control, and range of motion. Even small issues (e.g., instability, poor setup, half reps) can impact progress or increase injury risk.

✓ Assess Intensity:

Training hard enough is key for growth. Videos allow me to see how close you're taking sets to failure, if the tempo is controlled, and whether you're pushing yourself appropriately.

✓ Ensure Progress:

I can spot whether a lift is becoming too easy or if technique breaks down under load – this helps me decide when to change the exercise, load, or rep range.

✓ Injury Prevention:

Bad habits creep in unnoticed. Regular form checks help catch breakdowns before they cause pain or setbacks.

How to Record Training Clips:

- **Send 2 to 4 clips per session (especially compound or key lifts like presses, squats, rows, etc.)**
 - **Use the back-facing camera when possible for best video quality**
 - **Angle matters: Ideally, film from the side or at a 45-degree angle – I need to see full body movement, not just a partial view**
 - **Videos should be well-lit and stable – avoid shaking or off-angle shots**
-

Feel Awkward Filming in Public? Try This:

- **Use the front-facing camera and simply lean your phone against your water bottle or gym bag, facing toward the exercise**
 - **Start recording before your set – nobody will know you're filming**
 - **You're not filming to look cool – you're filming to improve**
 - **Remember: this is part of the process. It's not for social media, it's for your progress**
-

What to Avoid:

- ✗ Filming too far away or at odd angles where your movement isn't visible**
 - ✗ Clipped reps (start the video a few seconds before and after the set)**
 - ✗ Recording only isolation movements – prioritize compounds**
 - ✗ Sending only your best sets – I need to see your real effort and form**
-

Final Note:

Sending training clips is one of the biggest differences between casually working out and being coached to transform your physique.

The more footage I get, the more precise I can be with your programming and feedback.

OUTPUT

Cardio

Cardio - Low Intensity Steady State (LISS)

Cardio is a key tool in your fat loss phase – but we approach it with precision and control.

Here's how to do it correctly and what I need from you after each session.

Cardio Type & Intensity

- **Type:** Use a cross trainer, Cubii bike, or stationary bike
- **Purpose:** These machines allow us to complete cardio without counting toward your daily steps, which keeps step data clean and separate
- **Heart Rate Target:** Stay between 120-130 BPM throughout the entire session
- **You should feel like you're working, but still able to hold a conversation**

Tracking & Proof

- **Send a clear photo after completing your cardio**
- **Either from the machine display (showing time, distance, calories, etc.)**
- **Or a smartwatch screenshot showing heart rate and duration**
- **Must be sent after every cardio session – no exceptions**
- **Let me know if any cardio is missed, and why**

OUTPUT

Steps

Steps - Daily Movement Goal

Daily steps are essential for managing overall activity levels, recovery, and fat loss. Steps are tracked separately from your cardio.

Step Tracking

- Use your smartphone, smartwatch, or step counter to track steps throughout the day
- This is your baseline activity outside of training and cardio
- Check your step goal on your plan and ensure it's hit every single day

What to Send Me

- At the end of each day, send a screenshot of your total daily steps
 - Make sure it's clearly visible and readable
 - If you fall short, let me know and explain why
 - The more consistent you are with steps, the more accurate your weekly progress will be

ABDOMINAL TRAINING

Abdominal Training - Core Structure & Purpose

Your abdominal training is performed three times per week to develop both visible definition and deep core strength. This work supports posture, stability, and performance in your main lifts – while also contributing to a tighter, more conditioned midsection.

Here's your structured ab routine:

1. Crunches - 3 Sets

Focus: Upper Abdominals

- **Controlled tempo, no momentum**
 - **Keep lower back slightly pressed into the floor**
 - **Squeeze at the top, slow the way down**
-

2. Leg Raises - 3 Sets

Focus: Lower Abdominals

- **Keep legs straight and controlled**
 - **Avoid arching the lower back**
 - **Move slowly and deliberately through the full range**
-

3. Plank - 1 Set (Timed)

Focus: Core Strength & Stability

- **Brace your core, squeeze glutes, maintain a neutral spine**
 - **Hold for as long as possible with perfect form**
 - **Aim to progress your time each session**
-

✓ **Frequency:** Complete this full ab routine three times per week on non-consecutive days (e.g. Monday, Wednesday, Friday).

TRAINING EXPLANATION

SS COACHING - TRAINING GUIDELINES

These principles will apply across all your training sessions. Read carefully and apply consistently to get the most out of your plan.

Rest Days

We follow the plan exactly as laid out. However, rest days may be adjusted depending on recovery, fatigue, or scheduling. The rule: if we need to rest, we do – but we don't skip sessions without communication.

Training Intensity

Always train hard – not just to move the weight, but with intent. The last rep should be close to failure (RIR 0-1).

- No swinging, no explosive momentum.
 - Focus on perfect execution, full control, and proper tempo.
 - Drive the target muscle through the full range with tension at all times.
-

Warm-Up Sets

Never jump straight into your heavy sets.

- Use 1-3 warm-up sets to gradually prepare the body.
- Focus on increasing load slightly each warm-up while maintaining perfect form.
- Once ready, move into your working sets.

Example: If you're doing a heavy shoulder press for 3 working sets, warm up with lighter sets to activate the area and prepare the joints.

Heavy Sets

Your heavy sets are your key lifts – these demand focus and intensity.

- You should reach your rep target within 1-2 reps of failure.
 - Use controlled form, full range, and no sloppy execution.
-

Top & Back-Off Sets

Some exercises will include both a top set (heaviest, lower reps) and a back-off set (lighter weight, higher reps).

- Your top set should be 6-9 reps with full intensity.
- Your back-off set should be 10-15 reps with slightly less weight, but just as much control.

Progression Focus

Every session, aim to beat your previous performance – either by:

- **Increasing the weight**
- **Repeating the same weight for more reps**
- **Improving control and form**

Example: If you did 10 reps of leg press at 150kg last week, try for 11-12 reps this week – or go to 160kg for 8 solid reps.

Medium-Load Sets

Some exercises use a more moderate weight with higher reps (e.g. 12-15).

- **The weight should still challenge you – but control and connection come first.**
 - **Squeeze, slow the tempo, and don't rush through the movement.**
-

Execution is Everything

Tempo, range of motion, and muscular control are more important than chasing numbers.

- **Don't rush sets.**
 - **Don't ego lift.**
 - **Treat every set like it matters – because it does.**
-

Training Clips

You must send 2-4 training clips per session to allow proper review.

- **These help me monitor technique, form breakdown, and progression.**
- **Angle the camera to clearly show the movement – back-facing camera preferred.**
- **If filming feels awkward, use your front camera and lean it against your water bottle – discreet and effective.**
- **I don't need fancy edits – I need raw, honest training footage.**

FOOD EXPLANATION

SS COACHING - NUTRITION GUIDELINES

These guidelines are the foundation of your physical transformation. To get the most from your coaching, you must follow these instructions with precision and consistency. Every gram, every meal, and every decision matters.

1. No Milk or Sugar

- Do not use dairy milk or table sugar
 - Use unsweetened almond milk and zero-calorie sweeteners only
-

2. Food Measurements - Always Use Raw (Uncooked) Weight

- All foods must be weighed in raw (uncooked) weight – this includes meats, rice, oats, pasta, and vegetables
 - Do not weigh foods after cooking unless stated otherwise
 - Potatoes must also be weighed raw
 - Use digital kitchen scales – no guessing or eyeballing
-

3. Meal Timing - Breakfast

- Eat your first meal within 30 minutes of waking
 - If you are doing fasted cardio, eat your first meal immediately afterward
-

4. Cereal Swaps (If Applicable)

- If your plan includes cereal, you can switch to a different kind – as long as you match the carbohydrate content
 - Use packaging labels or MyFitnessPal to adjust your portion size accurately
-

5. Fruit Swaps

- You can swap between fruits with similar carbohydrate values
- Do not assume all fruits are equal – check the label or track it
- Keep fruit portions consistent and within plan

6. Meal Frequency

- **Eat every 2 to 4 hours**
 - **Space your meals evenly across the day**
 - **Avoid long gaps – this helps regulate blood sugar, supports digestion, and improves energy**
-

7. Lean Meats

- **All meats must be at least 90% lean, preferably 5% fat or less**
 - **Approved options: chicken breast, turkey breast, 5% lean beef mince, white fish**
 - **All meat must be weighed raw**
-

8. Greens & Vegetables

- **Include one portion of green vegetables with every main meal**
 - **Choose options like spinach, courgette, green beans, broccoli, asparagus, peppers**
 - **Do not cook vegetables in oils or butter – steam, boil, or air fry**
-

9. Rice & Carbohydrate Swaps

- **You may swap rice for:**
- **Sweet potato**
- **White potato (weighed raw)**
- **Oats**
- **Wholemeal pasta**
- **Always match the carbohydrate content, not the weight**
- **Example: 50g carbs from rice does not equal 50g from sweet potato**
- **Track swaps properly using food labels or apps**
- **Let me know if a certain carb source causes bloating or discomfort**

10. Condiments & Extras

Allowed in moderation – check labels for hidden calories or sugar:

- Salt (within your sodium target)
- Fresh/dried herbs and spices
- Balsamic vinegar
- Sugar-free sauces
- Low-sugar ketchup
- Zero-calorie syrups
- Black coffee or coffee with almond milk
- Diet sodas / zero-calorie drinks (1-2 daily max)

✗ Avoid:

- High-calorie dressings
 - Butter
 - Oils
 - Alcohol
 - Full-sugar fizzy drinks
-

11. Sodium & Water Intake

Sodium Targets (Daily):

- Men: 4,000 - 6,000 mg
- Women: 3,000 - 5,000 mg
- Salt all meals consistently – especially around training
- Use sea salt, pink salt, or table salt – the type doesn't matter, but consistency does

Water Targets (Daily):

- Men: 4.5 - 6 liters
 - Women: 3.5 - 5 liters
 - Increase intake on training days or in hotter conditions
 - Sip water steadily throughout the day – don't overload it in one go
 - Electrolyte supplements are optional but can be helpful when training intensity is high
-

12. Free Meal / Cheat Meal

- You are allowed one free meal per week
 - This meal includes:
 - One main course
 - One dessert
 - It must replace your final meal after your weekend check-in – either:
 - Friday (if you check in on Friday), or
 - Saturday (if your check-in is Saturday)
 - This is a controlled break – not an excuse to binge
 - Get back on plan immediately afterward. No snacking, alcohol, or additional off-plan meals around it
-

✓ Stick to these basics. Master the small details. That's how real, lasting results are built.

FINAL NOTE

This guide is the exact blueprint to get into the best shape of your life – both physically and mentally. 🎯

It's built from experience, results, and what actually works.

Whenever you feel uncertain or off track, revert back to this.

Your personalized plan is on its way – stay tuned.
